

# DUAL-ALARM AM/FM CLOCK RADIO

**Team W.O.R.K**

**Matthew Kay, Omer Omer, Ricky Ramos, Colton Williams**

**Vision:**

The goal of this project is to create the software that controls a Dual Alarm AM/FM Clock Radio. The software must support the use of two alarms that can be set to a desired time. The clock radio must also be able to switch between AM and FM and connect to specific radio stations as selected by the user.

### **Use Case UC1: Setting the Alarm**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	Setting the alarm so it goes off at desired time
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock owner: wants an alarm to go off at the specified time
<b>Precondition</b>	Clock is on and is able to accept hours, minutes, seconds, and AM/PM settings for the alarms. Also, the software needs to distinguish between setting the alarm and setting the current time. The software needs to know if the alarm is on or off. The software needs to make sure it goes off and makes a noise at the desired time.
<b>Success Guarantees</b>	The clock takes in the desired hours, minutes, seconds, and AM/PM settings and saves them in memory for alarm 1 or 2. The alarm will sound at the correct time as long as the user has not cancelled the alarm.
<b>Main Success Scenario</b>	The clock owner enters the alarm time into the alarm, and the software saves the time into memory. The software saves the desired time of 8:40 AM to alarm 1. The alarm goes off at 8:40 AM, and the clock owner wakes up at the correct time and is not late for work.
<b>Extensions</b>	The clock owner wants to cancel an alarm that is currently in the process of being set. The user will repeatedly press either the Alarm 1 or Alarm 2 button, and the software will recognize the cancellation of the alarm setting.
<b>Special Requirements</b>	The software must recognize HH:MM:SS AM/PM format for displaying the time
<b>Open Issues</b>	Does the software support military time? Will the software automatically adjust for Daylight Saving Time?

**Use Case UC2: Switch Between AM/FM Radio**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	User is able to switch between AM or FM radio stations
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock Owner: Wants the ability to listen to various stations on either AM or FM radio Guests: Want the ability to change the radio AM/FM setting
<b>Precondition</b>	Clock is on and the software is able to recognize whether it is set to AM or FM.
<b>Success Guarantees</b>	User is able to change the radio either AM or FM radio. The user is able to switch back and forth between AM or FM radio at any given time.
<b>Main Success Scenario</b>	The user turns on the radio. The radio is currently set to AM and is on a station that is only broadcasting a static sound. The user switches the radio to FM radio.
<b>Extensions</b>	The user turns on the radio, and it is currently set to AM radio. The user attempts to switch to FM radio, but fails to do so.
<b>Special Requirements</b>	The software must be able to recognize and receive input from antenna.
<b>Open Issues</b>	Does the software support foreign radio stations?

### **Use Case UC3: Setting the Time**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	Setting the time on LCD screen
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock Owner: wants to set the clock to the proper time
<b>Precondition</b>	Clock is connected to the power source and has functioning buttons. Software must recognize HH:MM:SS AM/PM format.
<b>Success Guarantees</b>	The clock takes in the desired hours, minutes, seconds, and AM/PM settings and saves them in memory.
<b>Main Success Scenario</b>	The clock owner connects the clock to a power source, and it turns on. The display time is flashing at 12:00:00 AM. The user looks at the time on a phone and adjusts the clock to the appropriate time by operating the respective buttons.
<b>Extensions</b>	Scenario 1: The clock owner attempts to change the time after moving to a city with a different time zone. The owner presses the "Time" button in order for the software to prompt for input in HH:MM:SS AM/PM format. The user adjusts the clock to a specified time and presses the "Time" button once more. The correct time is now displayed.
<b>Special Requirements</b>	The software must recognize HH:MM:SS AM/PM format for displaying the time.
<b>Open Issues</b>	Will the software automatically adjust for Daylight Saving Time?

#### **Use Case UC4: Snoozing the Alarm**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	Snoozing the alarm for 9 minutes
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock Owner: wants to set to snooze the alarm for 9 minutes before going off again
<b>Precondition</b>	Clock is connected to the power source and at least one of the alarms has been set
<b>Success Guarantees</b>	The alarm will stop sounding and then go off again after 9 minutes if the snooze button is pressed
<b>Main Success Scenario</b>	The clock owner connects the clock to a power source and sets an alarm for the morning. The alarm goes off at the correct time, and the user presses the snooze button. The alarm successfully goes off again after 9 minutes.
<b>Extensions</b>	Scenario 1: The clock owner connects the clock to a power source and sets an alarm for the morning. The snooze button is pressed and the alarm stops sounding, but the alarm fails to go off again 9 minutes later. Scenario 2: The clock owner connects the clock to a power source and sets an alarm for the morning. The snooze button is pressed, but the alarm fails to stop sounding.
<b>Special Requirements</b>	
<b>Open Issues</b>	How many times can snooze button be pressed?

#### **Use Case UC5: Adjust the Volume**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	Control the volume of the radio
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock Owner: wants to adjust the radio to a comfortable volume Guests: want to adjust the radio to a comfortable volume
<b>Precondition</b>	Clock is connected to the power source and software supports volume control
<b>Success Guarantees</b>	The volume of the radio will increase or decrease as adjusted by the user
<b>Main Success Scenario</b>	The clock owner connects the clock to a power source and turns on the radio. The radio is initially too loud, so the user operates the volume knob to get to a comfortable volume
<b>Extensions</b>	Scenario 1: The clock owner connects the clock to a power source and turns on the radio. The volume is too high, so the user attempts to adjust the volume knob. The radio remains at the same volume.
<b>Special Requirements</b>	
<b>Open Issues</b>	

### **Use Case UC6: Tune the Radio**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	User is able to tune the radio on either AM or FM radio stations
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock Owner: Wants the ability to listen to various stations on either AM or FM radio Guests: Want the ability to tune the radio
<b>Precondition</b>	Clock is on and the software is able to recognize whether it is set to AM or FM and change the station
<b>Success Guarantees</b>	User is able to tune the radio to any station on AM/FM
<b>Main Success Scenario</b>	The user turns on the radio. The radio is currently set to AM and is on a station that is only broadcasting a static sound. The user switches the radio to FM radio and tunes to a station playing music.
<b>Extensions</b>	The user turns on the radio, and it is currently set to AM radio. The user attempts to switch to FM radio. The user begins to tune the radio, but it remains on the same station
<b>Special Requirements</b>	The software must be able to recognize and receive input from antenna. The software must be able to recognize when the tuning knob is being adjusted
<b>Open Issues</b>	Does the software support foreign radio stations?

**Use Case UC7: Turn the Radio ON/OFF**

<b>Primary Actor</b>	Clock Owner
<b>Goal in Context</b>	User is able to switch between AM or FM radio stations
<b>Scope</b>	Dual Alarm Clock Radio Software
<b>Level</b>	User Goal
<b>Stakeholders and Interests</b>	Clock Owner: Wants the ability to listen to various stations on either AM or FM radio Guests: Want the ability to change the radio AM/FM setting
<b>Precondition</b>	Clock is on and the software is able to recognize whether it is set to AM or FM.
<b>Success Guarantees</b>	User is able to change the radio either AM or FM radio. The user is able to switch back and forth between AM or FM radio at any given time.
<b>Main Success Scenario</b>	The user turns on the radio. The radio is currently set to AM and is on a station that is only broadcasting a static sound. The user switches the radio to FM radio.
<b>Extensions</b>	The user turns on the radio, and it is currently set to AM radio. The user attempts to switch to FM radio, but fails to do so.

**Glossary:**

- Dual Alarm AM/FM Clock Radio: A clock that supports the setting of two alarms and has the capability of receiving and interpreting radio waves to output information to the user.
- Vision: A short executive overview document for quickly learning the project's big ideas
- AM/FM: Amplitude Modulation and Frequency Modulation, respectively. These are forms of modulation in which either the amplitude(strength) or frequency of a carrier wave is varied. The clock radio can be used with either setting.
- Software: The part of the computer system that consists of encoded information or computer instructions.
- Domain model:
- Use case:

**Supplementary Specification:**

- Functionality:
  - User will have the ability to:
    - Set the alarm
    - Switch between AM/FM radio
    - Set the time
    - Snooze the alarm
    - Adjust the volume
    - Tune the radio
- Usability:
  - Human Factors:
    - The user should have the basic ability to read the buttons.

The user will be able to see the the time and on a large LCD screen. Therefore:

    - The time should be easily read from more than a few meters away.
    - The color of the numerical digits will be in red with a black background for good contrast to aid those with poor eyesight.
- Reliability:
  - Failure rate of alarm to go off should be very low.
- Performance:
  - The radio should be able to tune to the desired station and start outputting music within a couple seconds.
  - The clock should respond immediately to the snoozing/disabling of the alarm.
- Supportability:
  - Software will not need to be updated
  - Configurability:
    - Different users may control which preset stations to use.
    - The alarms may be set to any time the user desires.

#### Interfaces:

##### Noteworthy Hardware and Interfaces:

- LCD Screen
- Buttons:
  - Main On/Off
  - Alarm 1 On/Off
  - Alarm 2 On/Off
  - Radio Tuning Knob
  - Volume Up/Down Knob
  - Adjust Hours
  - Adjust Minutes
  - Adjust Seconds
  - Adjust AM/PM
